CAREER SUMMARY

QA automation engineer and QA Lead with 3 years testing gaming, web, mobile and streaming platforms for Electronic Arts, Adobe, Disney+, ESPN, Vix (Televisa Univision), LA Clippers and Jerónimo Martins. Currently Automation POC at Electronic Arts, driving automation strategy, distributed execution infrastructure and release-facing reporting. Builds and maintains public CI-backed frameworks in Playwright/TypeScript, Appium/Java and REST Assured, covering cross-platform mobile execution, API contract validation, accessibility and visual regression. Integrates AI into the test loop — MCP authoring agents, in-test LLM assertions and CI failure triage — as an optional layer the suite can run without.

SKILLS & TOOLS

Testing: Test Strategy & Planning, Test Case Design, Regression, Smoke, Exploratory, Integration & UAT, Accessibility (axe, Google ATF), Visual Regression, Performance Budgets, Mutation Testing, Cross-Platform & Parallel Execution

Automation Frameworks: Playwright (TypeScript), Appium 3 (Java 21, JUnit 5/6), WebdriverIO (JavaScript), Selenium WebDriver, Maestro, Cucumber / Gherkin / BDD, Page Object Model, device pooling & port isolation

APIs & Debugging: REST API Testing (Postman, REST Assured, Playwright API), JSON Schema / OpenAPI contract validation, PostgreSQL & PostgREST, Charles & Proxyman, Datadog

Languages & Build: TypeScript, Java 21, JavaScript, Python (scripting), SQL / MySQL, JSON / YAML, Gradle (Kotlin DSL), Maven, Node.js

CI/CD & Reporting: GitHub Actions (sharded matrices, Android/iOS emulator lanes), Jenkins, GitLab CI, Docker, Testcontainers, Allure, Playwright HTML reports, branch protection, gitleaks secret scanning, Dependabot, ESLint / Prettier

AI & Emerging Tech: Claude Code (agentic development workflows), MCP server integrations (Playwright MCP, Appium MCP), in-test LLM assertions, AI-powered CI failure triage, AI-assisted test authoring

Other: Jira, Xray, QMetry, TestRail, Adobe Experience Manager (AEM), Adobe Journey Optimizer (AJO), Adobe Target, Agile / Scrum

PROFESSIONAL EXPERIENCE

Electronic Arts (EA) — QA Lead Tester · Automation POC

January 2026 – Present

- Drive automation strategy and execution across large-scale validation workflows as Automation POC.
- Lead end-to-end automation pipelines, including execution, monitoring and failure analysis.
- Support distributed test infrastructure — environments, execution setups and configurations — and contribute to automation script configuration and execution logic (JSON/Python-based workflows).
- Deliver reporting and insights from automation runs to support release decisions; manage pipeline execution, source control and test traceability across Jenkins, GitLab and QMetry.
- Collaborate with engineering teams to troubleshoot automation reliability and identify opportunities for automation expansion and workflow optimization.

Globant — QA Engineer / QC Analyst

August 2023 – January 2026

Client projects: Adobe · Disney+ / ESPN · Vix (Televisa Univision) · LA Clippers / Intuit Dome · Jerónimo Martins

- Adobe (Reader, Lightroom): manual QA on mobile and desktop covering notifications, document interactions and key user flows; smoke and regression across OS versions and devices.
- Disney+ / ESPN and Vix: streaming QA for playback, profiles, onboarding, metadata and navigation, with network validation via Charles/Proxyman.
- LA Clippers / Intuit Dome: web and mobile QA for ticketing, loyalty and fan-facing features; API validation, analytics event verification and AEM content checks.
- Jerónimo Martins: served as Test Lead, coordinating test planning, coverage and release validation for login, promotions, store locator and search.
- Built automation support with Selenium WebDriver and Playwright, applying BDD with Cucumber and Gherkin; validated personalization with AEM, Adobe Target and AJO; debugged analytics flows with Datadog.
- Managed defects and traceability in Jira/Xray and TestRail within Agile delivery teams.

AUTOMATION PROJECTS (OPEN SOURCE)

[appium-java-mobile-automation](#) · Appium 3 · Java 21 · JUnit 6 · Gradle · Android + iOS · Allure

- Cross-platform mobile framework where a single test runs on Android and iOS with no platform branching: device pool with per-slot port isolation, in-place app upgrade testing, performance budgets, accessibility audit and visual regression across six CI lanes (two Android API levels and a real iOS simulator).

- Manages flaky tests with time-boxed quarantine — each quarantined test carries an expiry date and fails the build once it lapses, so instability is reviewed rather than absorbed by retries. The AI locator-healing layer logs every rescue with its evidence and requires explicit review, and a dedicated CI job removes the module entirely and reruns the suite to verify the framework works without it.
- Diagnosed a slow, intermittently red iOS lane from Appium session timings instead of guesswork: the first session cost 432s against a 420s client timeout, and session setup accounted for 63% of the lane. Raised the ceiling against the measurement and moved cold start into a self-verifying warm-up step.

[playwright-ai-integration-e2e-api](#) · Playwright · TypeScript · MCP · CI/CD · API

- E2E and API framework with deep AI integration — MCP authoring agents, in-test LLM assertions and AI-powered CI failure triage — on Page Objects, sharded CI, accessibility and visual regression.
- Handles an anti-bot challenge served to datacenter IPs by deciding reachability on the runner that will execute the tests, skipping rather than failing; an earlier design asked from a different machine, and therefore a different IP and a different answer.

[restassured-automation](#) · REST Assured · Cucumber 7 · JUnit Platform · Testcontainers · PostgreSQL / PostgREST

- API suite that starts its own dependency stack — Postgres and PostgREST in Testcontainers — so the whole suite runs with a single Maven command: no API key, no account, no hosted sandbox to go stale. Replaced a suite pointed at a shared mock that had hit its row cap and been failing ever since.
- A real database lets negative tests assert real behaviour: 23505 on duplicate email, 23514 on a failed CHECK, and a genuine race where two writers contend for one unique index.
- A CI job reruns the suite against a deliberately weakened schema and requires every assertion on a checked-in list to go red. Writing that list down exposed real negative coverage as five of nine scenarios, not nine of nine, with the remainder documented rather than quietly counted.

Repository engineering practice

- Protected main with required pull requests, enforced status checks, linear history and no force pushes; secret scanning over full git history validated by a planted synthetic key, so a misconfigured scanner cannot pass as a clean repository; Dependabot on every ecosystem after three separate outages traced to dependency rot rather than test code.

CERTIFICATIONS

Testing & Automation: ISTQB Foundation Level V4.0 — Complete Training (Udemy) · Selenium WebDriver with Java (Udemy) · Agile Testing (LinkedIn Learning)

API & DevOps: Postman API Fundamentals Student Expert (Postman) · DevOps CI/CD with Jenkins, Pipelines & Docker (Udemy)

Process: Scrum Fundamentals Certified — SFC (SCRUMstudy)

EDUCATION & LANGUAGES

Education: BTech, Software Analysis and Development — Servicio Nacional de Aprendizaje (SENA), 2022–2024

Languages: Spanish — Native · English — C1 Professional
